

Pergoveris® – uloga LH u stimulaciji ovulacije

Hrvoje Vrčić

Medicinski fakultet Sveučilišta u Zagrebu

Klinički bolnički centar Zagreb

PM-FER-06/16 22/04/2016

RAZOTKRIVANJE

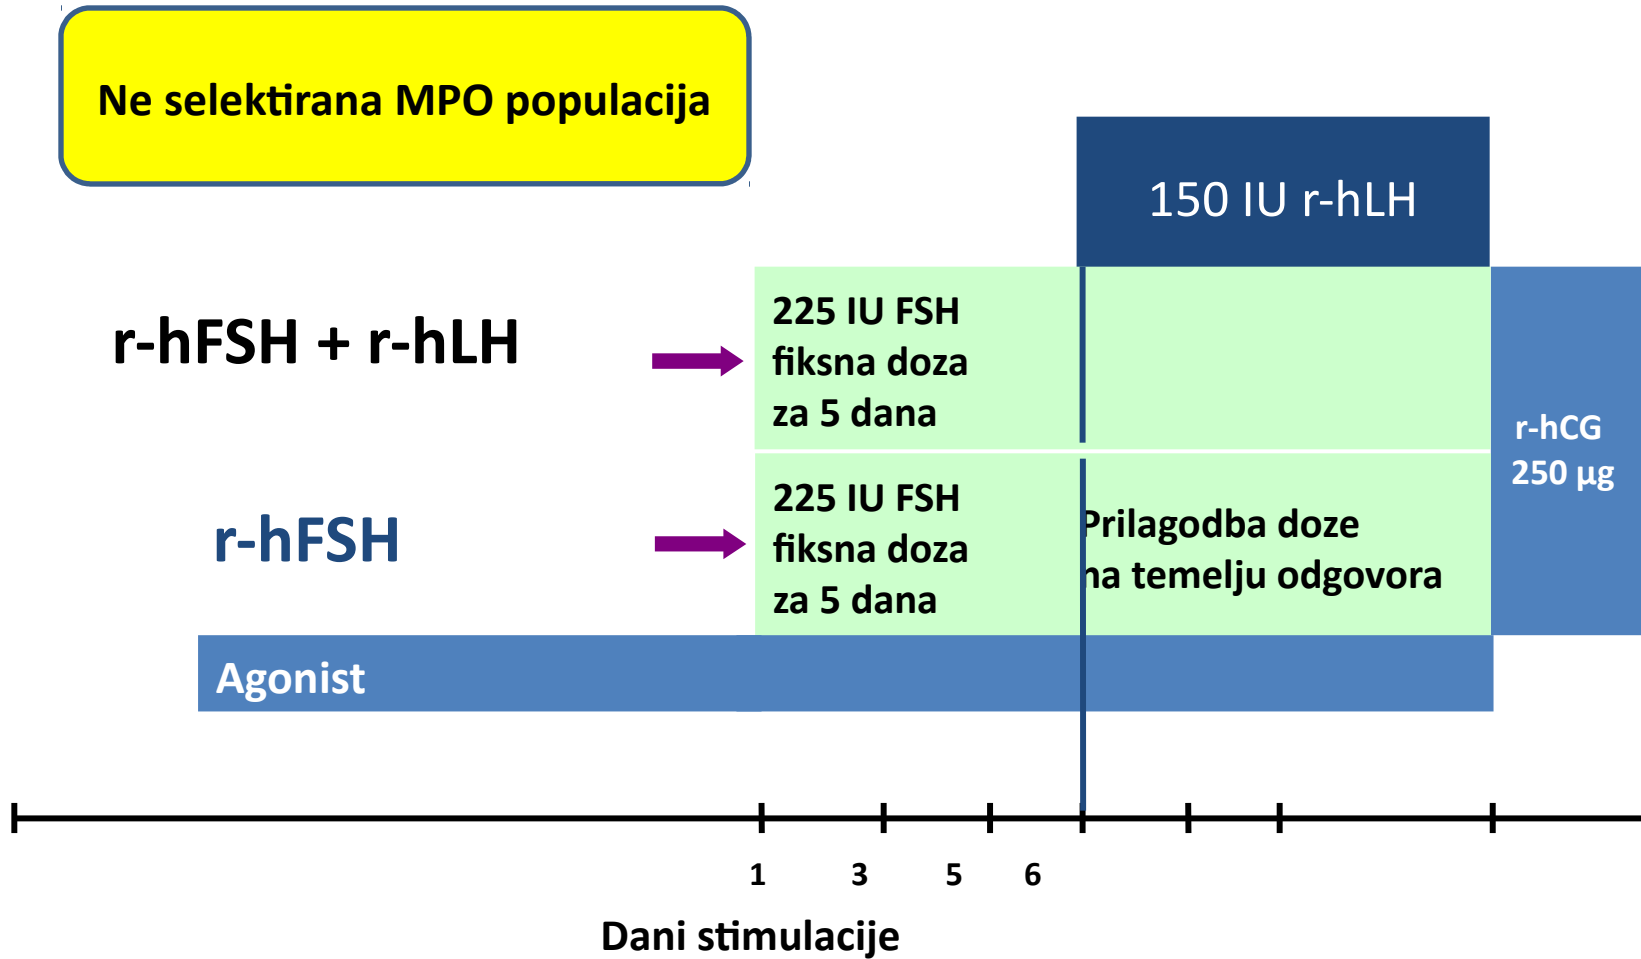

Predavač prezentira u ime tvrtke Merck koja je sponzor ovog predavanja. Prikazane informacije u skladu su sa svim primjenjivim zakonima.
Samo za zdravstvene radnike.

- Stimulacija ovulacije
- Primjena r-hLH
- Fiksna kombinacija r-hFSH + r-hLH
- Rezultati studija

PRIMJER 1

- Dokazi za korištenje r-hLH u:
Ne selektiranoj MPO populaciji

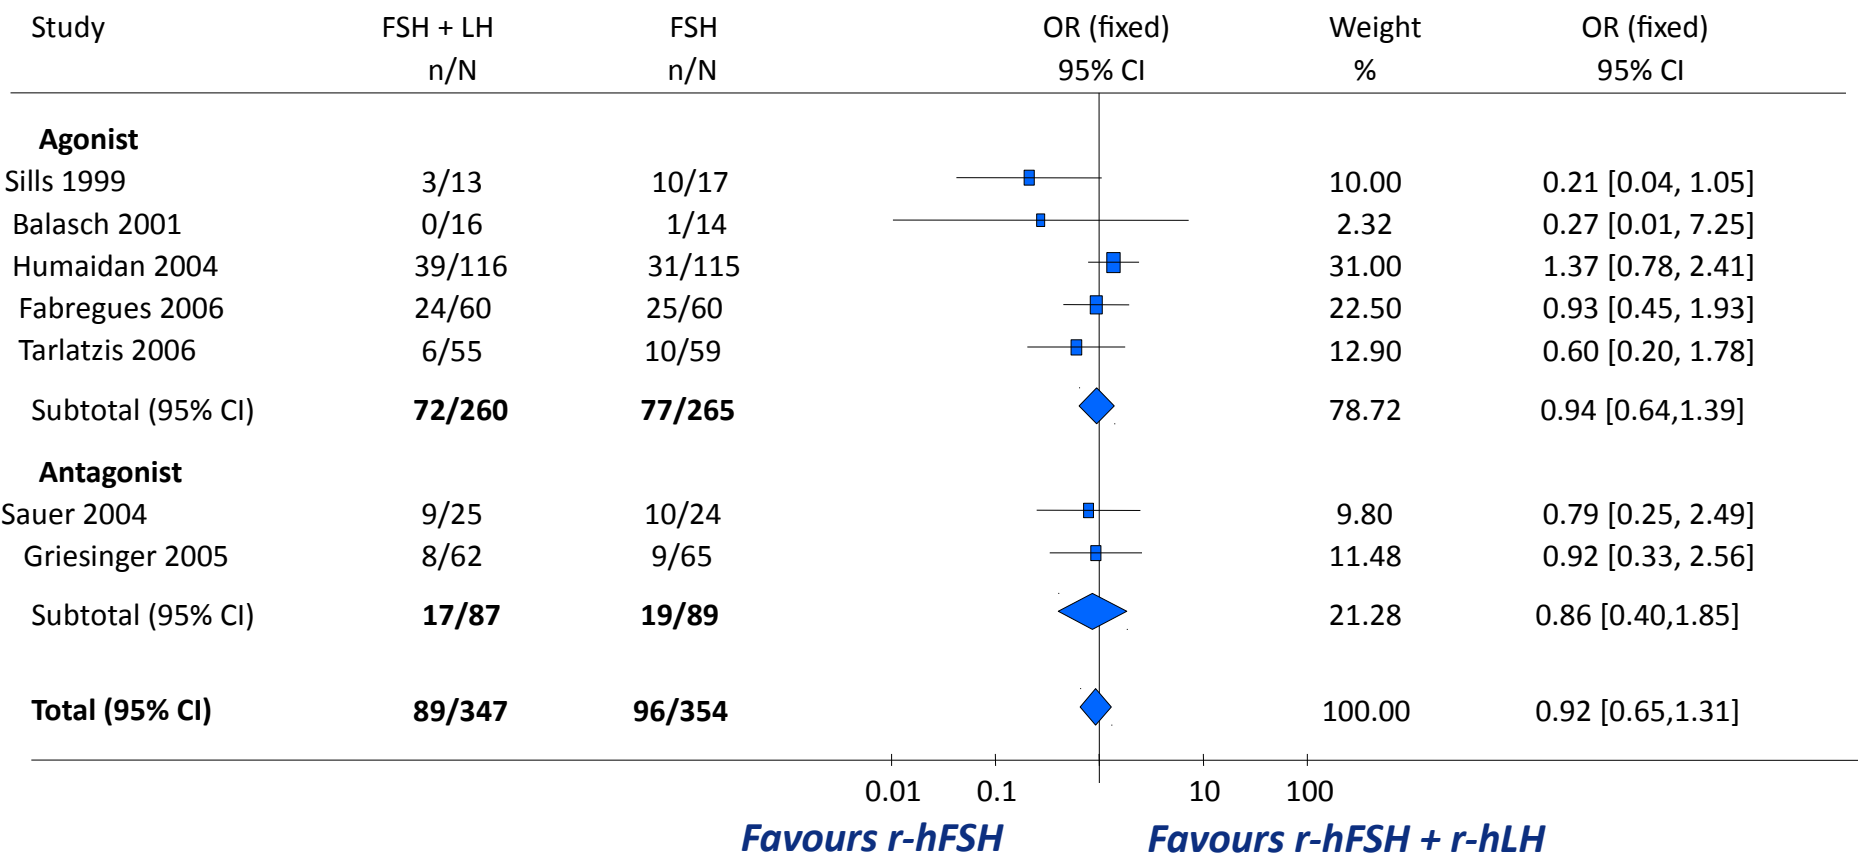

Komparativne MPO studije

adapted from Buhler et al. Recombinant human LH supplementation versus supplementation with urinary hCG-based LH activity during controlled ovarian stimulation in the long GnRH-agonist protocol. *Gynec Endocr*, 2012; 28(5): 345–350

Ne selekcionirana MPO populacija – Stopa živorođenih

r-hFSH vs r-hFSH + r-hLH (Kolibianakis EM, Hum Reprod Update, 2007)

Marginalno u korist r-hFSH, bez vjerodostojne razlike

Sažetak

- Dodavanje LH nije pokazalo korist u neselektiranih MPO pacijentica
- Određene podgrupe pacijentica mogu imati korist od dodavanja LH

Primjer 2

- Dokazi za upotrebu r-hLH u skladu:

Ovarijski odgovor

Stopa trudnoća vs r-hLH i bazalni FSH

	STOPA TRUDNOĆA	
	Bazalni FSH <10 IU/L	Bazalni FSH ≥10 IU/L
Samo FSH	22% (n=180)	0% (n=26)
37.5ij rLH	20% (n=69)	31% (n=26)
75ij rLH	34% (n= 47)	26% (n=23)

P<0.05

Supplementation with r-hLH for Women showing hypo-responsiveness to FSH under GnRH agonist down-regulation

(Ferraretti et al 2004 SISMER Reproductive Unit, Italy)

Hyporesponsiveness

- Normal initial follicular recruitment
- (10 antral follicles >8 mm in diameter and E2 >100 pg/mL)

Between day 7 and day 10 of the cycle

- plateau of follicular growth
- no increase in the E2 level nor follicular size
- while continuing the same FSH dosage.

Ferraretti et al 2004 Fertil Steril 82, 1521-1526.

Supplementation with r-hLH for Women showing hypo-responsiveness to FSH under GnRH agonist down-regulation

(Ferrareti et al 2004 SISMER Reproductive Unit, Italy)

- Of **1,009 patients 130 patients were identified** as Hyporesponsive to FSH and randomised to:
 - Group A (n = 54) increased dosage of FSH
 - Group B (n = 54) recombinant LH and increased dose of FSH
 - Group C (n = 22) given additional FSH and LH using hMG
 - Group D (n = 54) age-matched control normal responders

Hyporesponsiveness to FSH

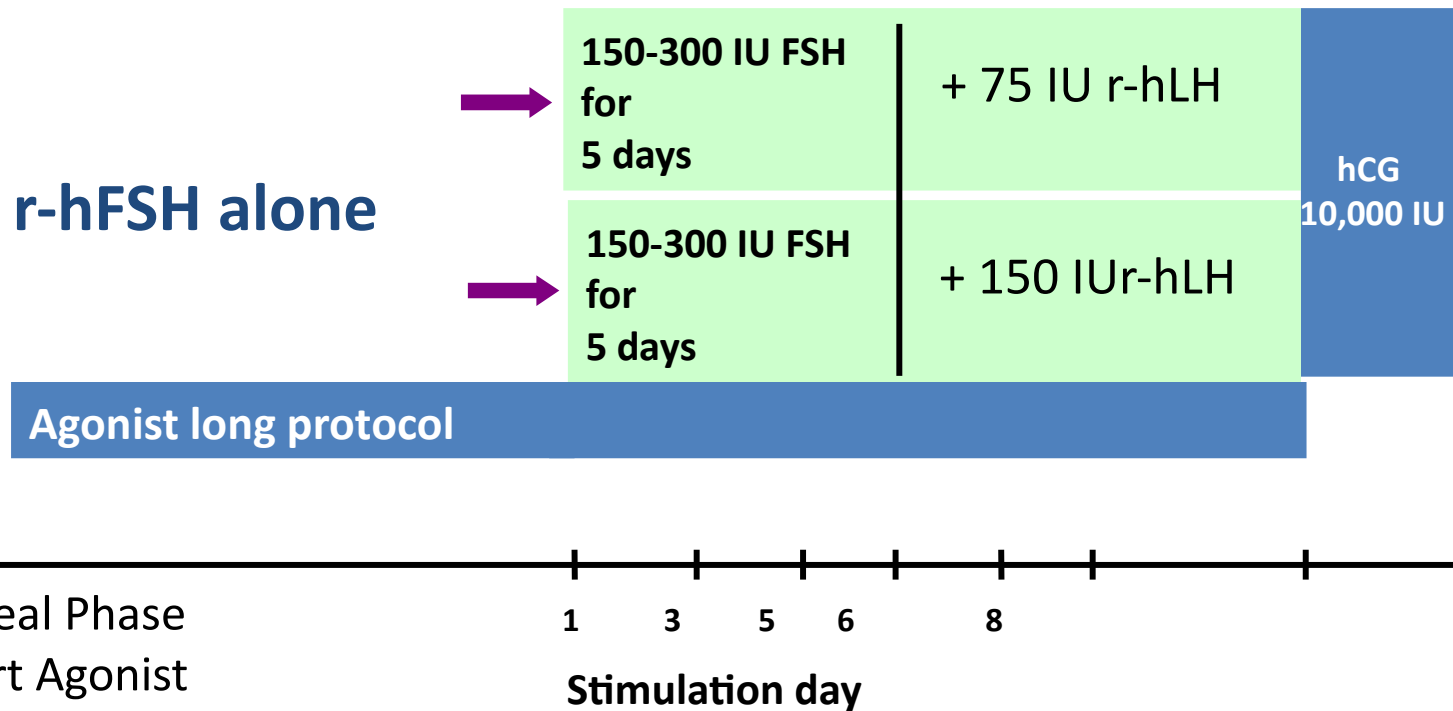

(Ferraretti et al 2004 Fertil Steril 82, 1521-1526)

	A. Increase r-hFSH	B. r-hLH & r-hFSH	C. HMG & r-hFSH	D. Control
N patients	50	54	22	54
Mean age	31.7	31.5	32.0	31.8

ART Results: IVF/ICSI outcome

Implantation rate (%)

Pregnancy rate (%)

De Placido et al, 2004

De Placido et al. 2004

- Optimalna doza r-hLH za MPO je 75ij r-hLH dnevno.
- Rezultati studije sugeriraju višu dozu 150ij r-hLH dnevno.
- To je u suprotnosti s preporučenom dozom od 75ij r-hLH dnevno u hipogonadalnih hipogonadotropnih pacijentica.

Italian Collaborative Group on Recombinant Human Luteinizing Hormone

(De Placido et al. 2005 Human Reprod 20, 390–396)

- 225 IU FSH daily following depot GnRH agonist

“Steady response”:

Day 8 stimulation

- Patients with serum E2 levels <80 pg/ml
- Ultrasound evidence of at least six follicles ranging between 6 and 10 mm,
- No follicle with a mean diameter >10 mm (‘steady response’) from day 5 to day 8.

Italian Collaborative Group on Recombinant Human Luteinizing Hormone

(De Placido et al. 2005 Human Reprod 20, 390–396)

- Of **1,389** patients, **130** patients were identified as **“Steady response”** and randomised to:
 - Group A (n = 65) received 150 IU of r-hLH daily while maintaining same daily dose of r-hFSH
 - Group B (n = 65) had an increase of 150 IU in the daily dose of r-hFSH (step-up protocol).
 - Group C (n=130) normally responding control women

“Steady response” to FSH

(De Placido et al. 2005 Human Reprod 20, 390–396)

	A r-hLH 150IU & r-hFSH	B Increased r-hFSH 150IU	C Control

Poor responders r-hFSH alone vs r-hLH + r-hFSH

(Mochtar MH, Cochrane Database, 2007 issue 2)

Review: Recombinant Luteinizing Hormone (rLH) for controlled ovarian hyperstimulation in assisted reproductive cycles

Comparison: 03 rLH and rFSH versus rFSH alone for COH in GnRH agonist downregulated IVF/CSI cycles in poor responders

Outcome: 01 Ongoing pregnancy per woman randomised

Sažetak

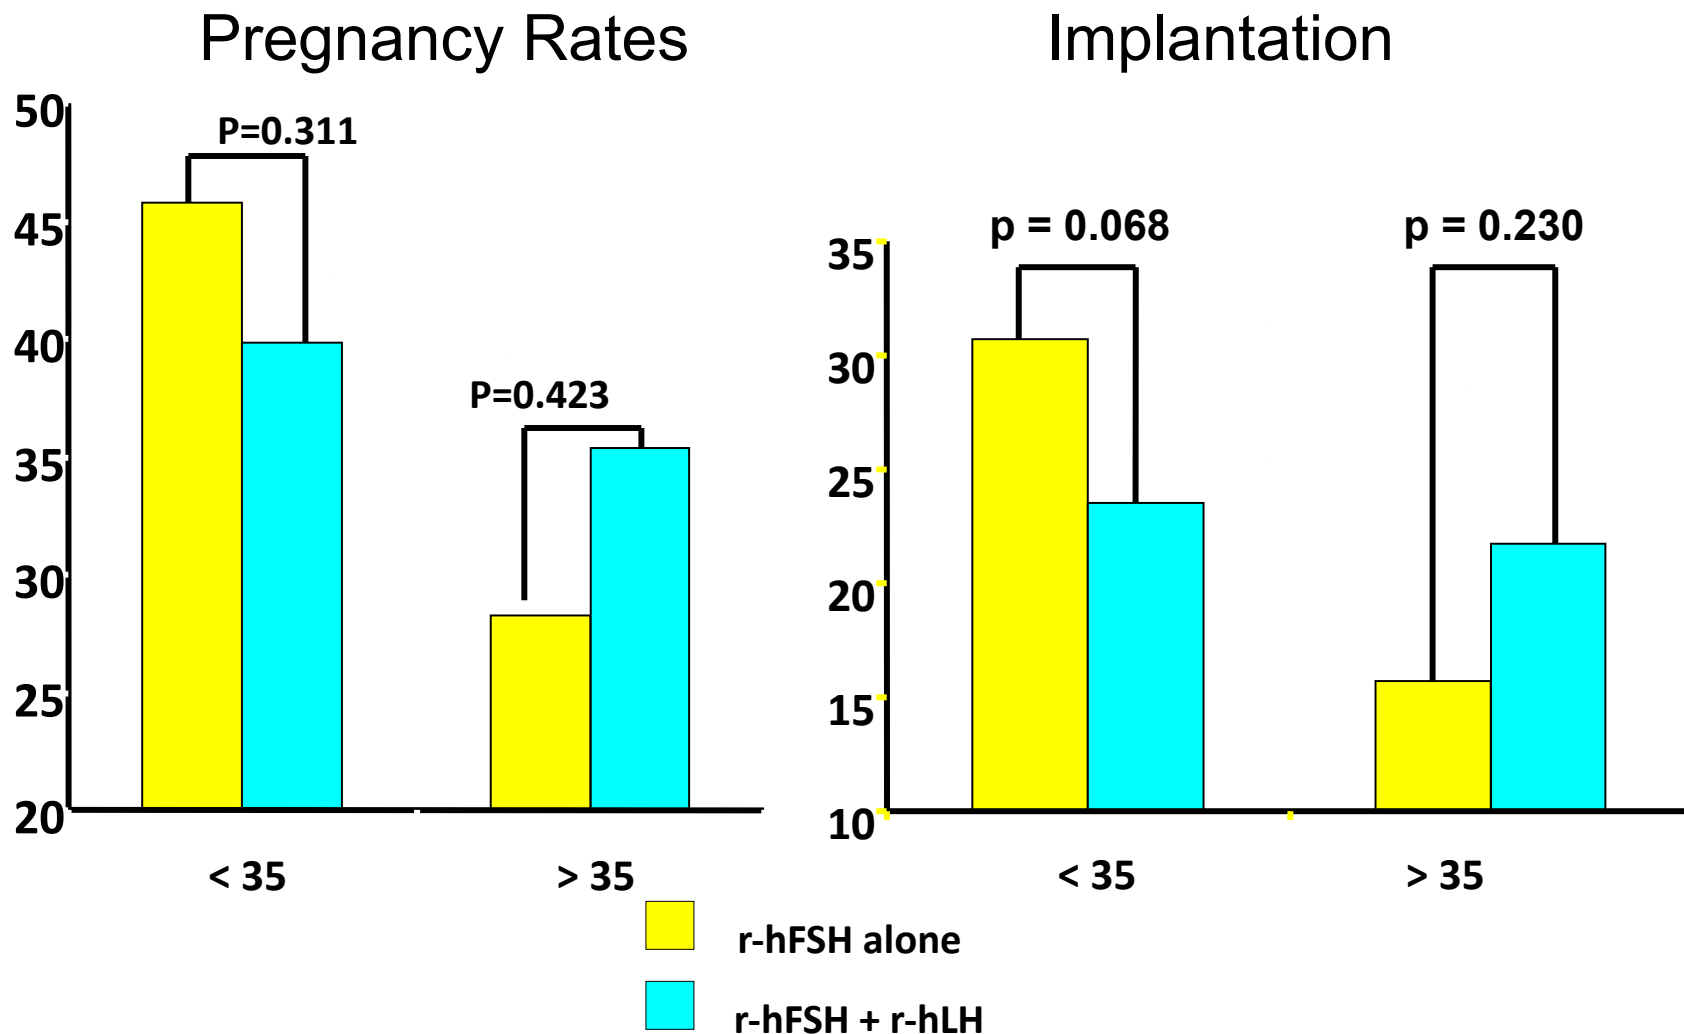

- Žene s umanjenim odgovorom na FSH mogu imati koristi od egzogenog r-hLH.
 - r-hLH može poboljšati razvoj oocite, implantaciju i stopu trudnoća u hiporespondersa na FSH.
- Cirkulirajuće razine LH nisu prediktivne kakav će biti odgovor

Primjer 3

Upotreba r-LH u MPO u starijih žena

stopa kliničkih trudnoća

Study	Sample size (patients)	Measure (CI)	Weight %
Marrs 2004	88	2.91 (1.14; 7.42)	6.73%
Humaidan 2004	39	1.75 (0.42; 7.35)	3.64%
Fabregues 2005	120	0.93 (0.45; 1.93)	18.99%
NyboeAndersen 2008	100	0.59 (0.25; 1.42)	16.87%
Barrenetxea 2008	84	1.15 (0.41; 3.19)	8.68%
Mattoras 2009	131	2.14 (0.9; 5.12)	8.89%
Bosch 2011	340	1.49 (0.93; 2.38)	36.19%
Synthesis	902	1.37 (1.03; 1.83)	100%

Hill et al., Fertil Steril (2012), 97:1108-14

Sažetak

- U žena < 35 godina dodatak r-hLH ne donosi dobitak uz r-FSH
- U žena ≥ 35 godina dodatak r-hLH povezan je s nižom potrebnom dozom r-FSH, većom stopom implantacije i trudnoća.
- Dodatak LH možda može nadoknaditi smanjenje plodnosti zbog dobi, no potrebno je to potvrditi budućim studijama

Pergoveris® kod pacijentica s teškim nedostatkom FSH i LH

Pergoveris[®] za pacijentice s teškim nedostatkom FSH i LH

LH

LH

Uloga FSH u menstruacijskom ciklusu (temelj za dominanciju i selekciju)

1. Potiče razvoj folikula
2. Inducira aromataznu aktivnost u granulosa stanicama
3. Inducira sekreciju estradiola
4. Inducira LH receptore na granulosa stanicama
5. Negative povratna sprega za vlastitu sekreciju: temelj za dominantnost

Uloga LH u menstruacijskom ciklusu

Folikulinska faza

Potiče androgenu sekreciju u teka st.
Sinergijsko djelovanje s FSH u stvaranju estrogena
Podrška dominaciji kad se razina FSH smanji

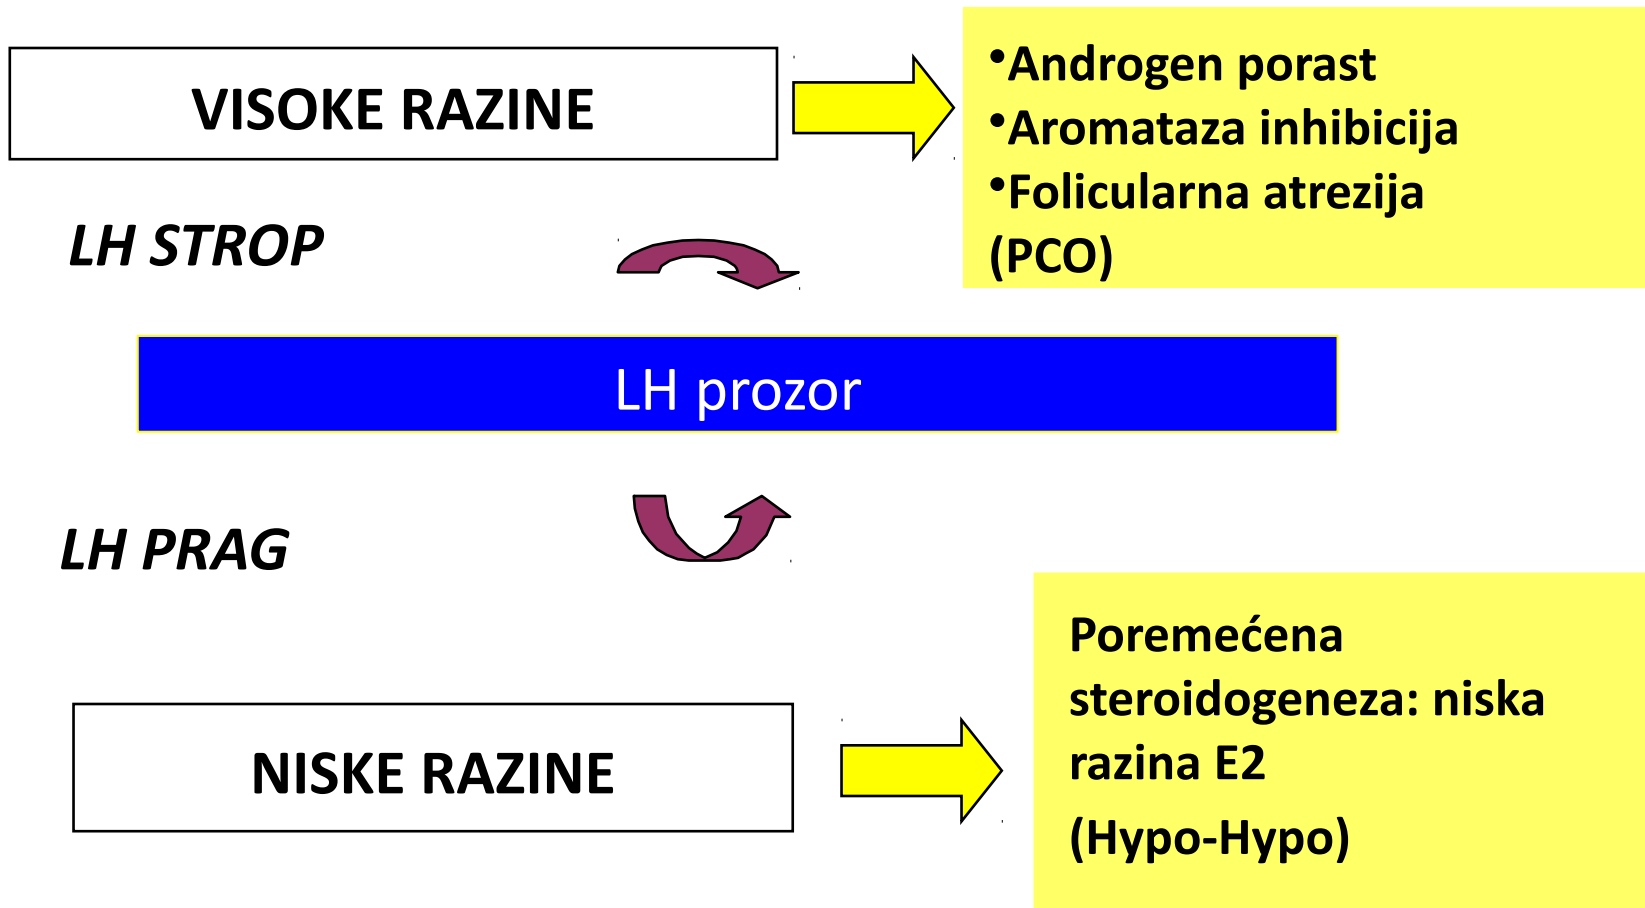

Sredina ciklusa

Nastavak mejoze u oociti
Sazrijevanje cumulus oophorus s oocitom
Ruptura folikula
Luteinizacija granuloze

Luteinska faza

Održavanje žutog tijela i sekrecija progesterona

LH učinak je ovisan o dozi

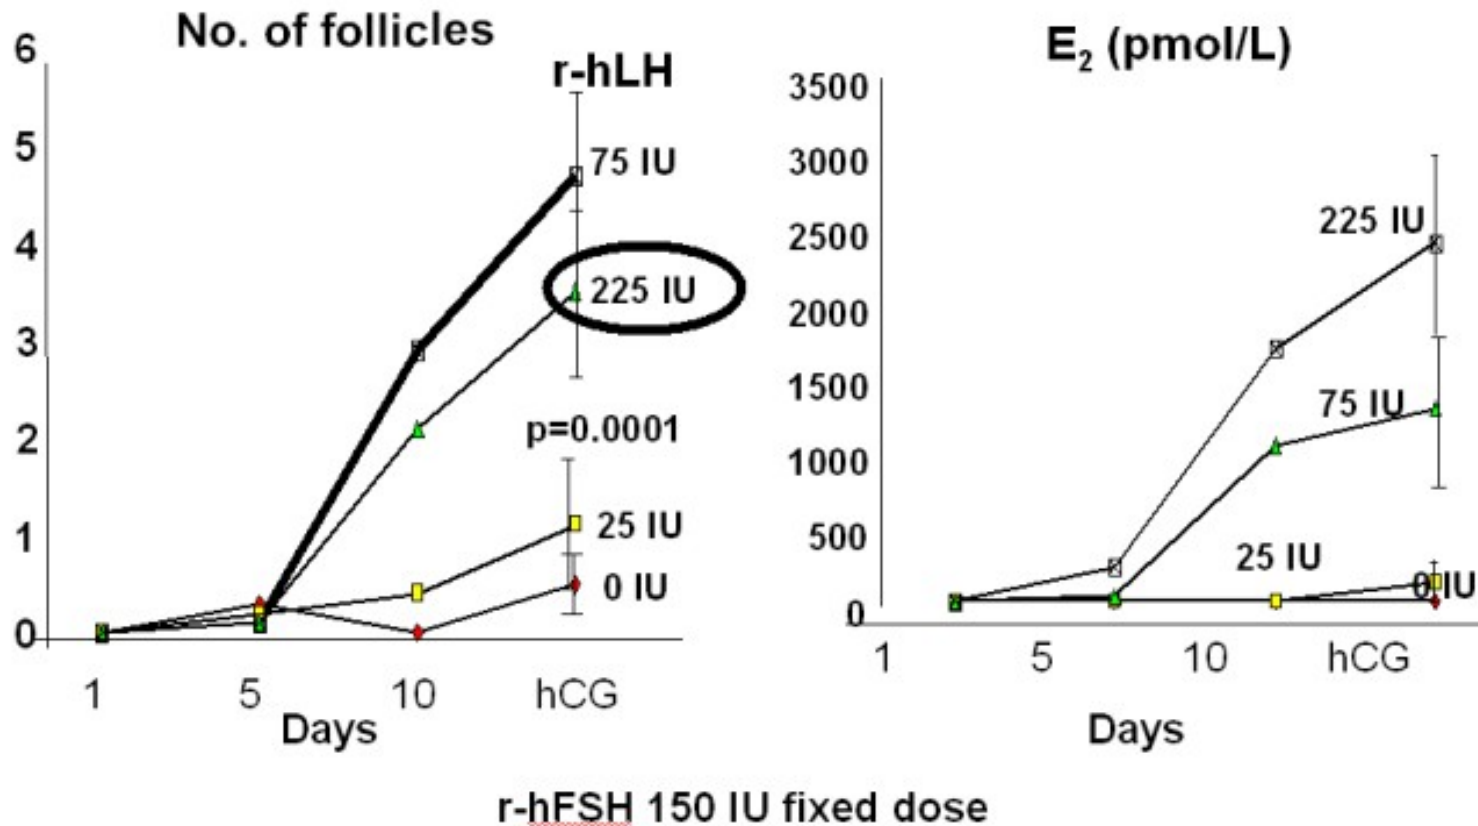

Hillier SG, Hum Reprod. 1994, 9:188-191

Sažetak

- FSH koncept praga (threshold concept)”: regrutacija i rast folikula je ovisan o pragu FSH. Ispod praga je folikularni rast zaustavljen (*Brown, 1978*)
 - Inicijalni folikularni rast je neovisan o LH.
 - LH prag je potreban za adekvatnu steroidogenezu
- LH koncept stropa (ceiling concept)”: rastući folikuli trebaju ograničenu količinu LH. Iznad te razine progresija je zaustavljena. (*Hillier, 1994*)
 - Visoka razina r-LH može zaustaviti rast folikula

Zaključak

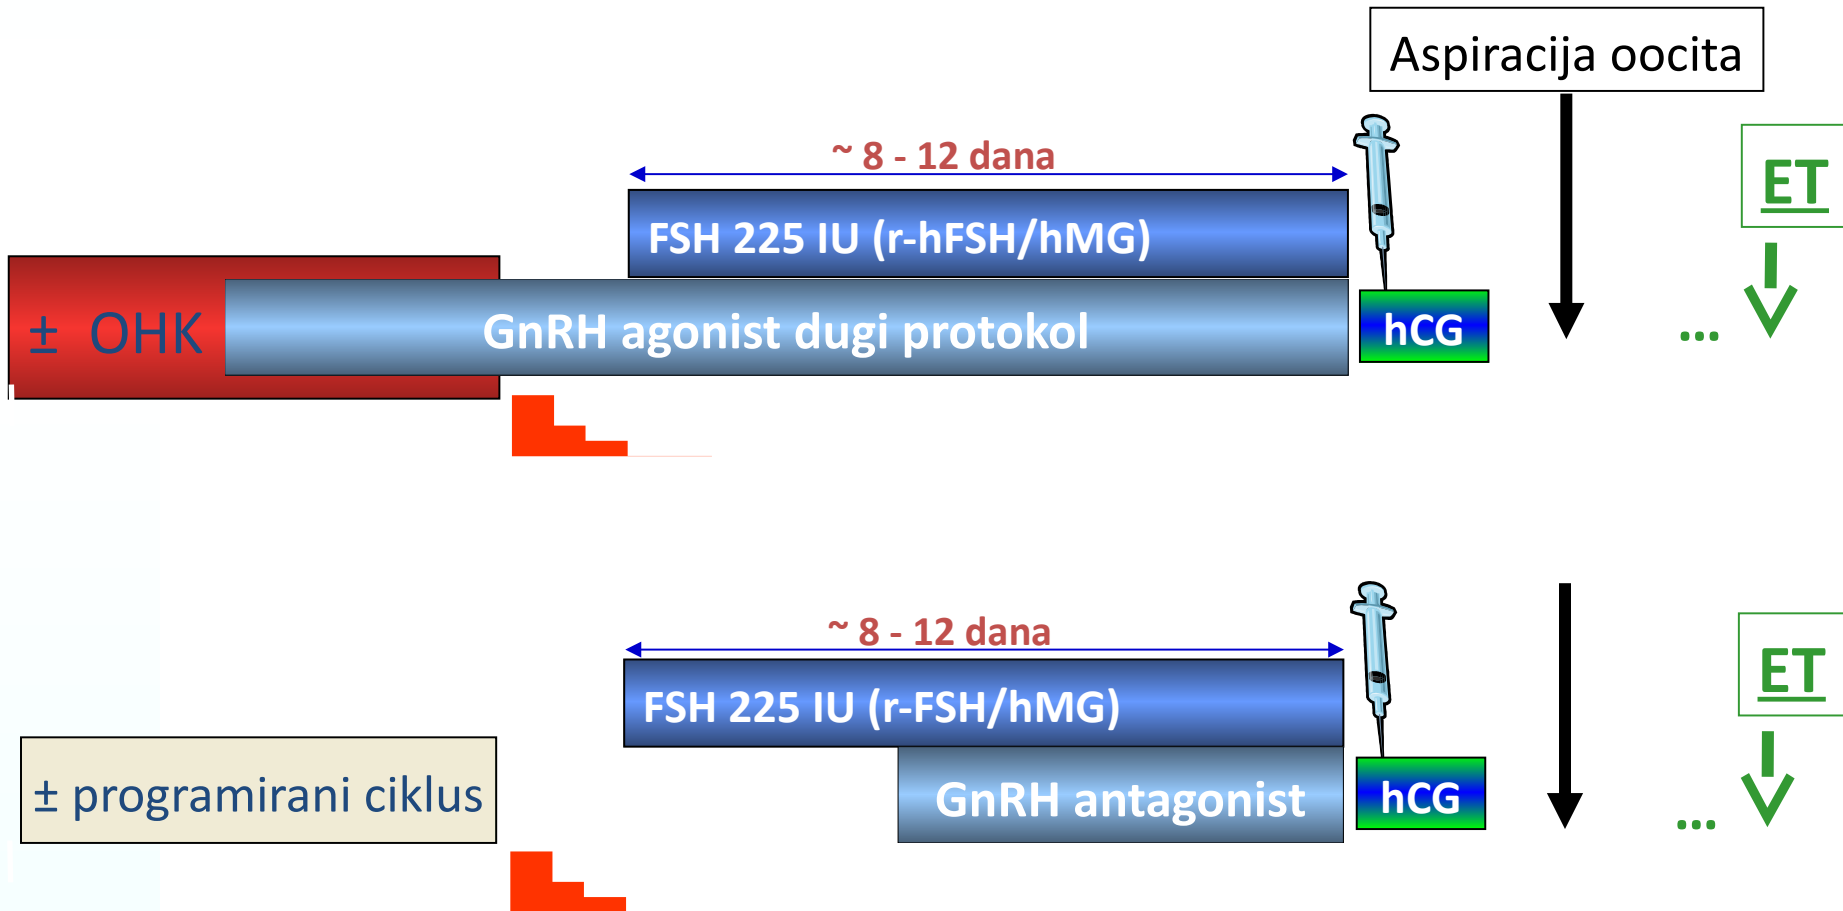

- Minimalna doza LH potrebna za indukciju ovulacije u pacijentica s teškim oblikom nedostatka LH je 75ij/dan.
- Optimalni odnos FSH i LH za indukciju ovulacije u navedenih pacijentica je odnos 2:1.
- Terapijske indikacije:
 - PERGOVERIS je indiciran za stimulaciju razvoja folikula u pacijentica s teškim nedostatkom FSH i LH.
 - U kliničkim studijama kriterij za odabir pacijentica je razina endogenog serumskog LH < 1,2 ij/L.

Zaključak

Smanjena osjetljivost na FSH može biti povezana uz nedostatak LH što sve zajedno može utjecati na kompetentnost oocite

Hipoteza ovog istraživanja da je potrebno povećati dozu FSH je pojedinačni biološki indeks (neizravni, ali vrlo specifičan) nedostatka LH, koji se ne može identificirati određivanjem razine LH u krvi.

Smanjena kompetentnost oocite ne može se povećati porastom doze FSH (grupa A). Može se povećati primjenom r-hLH (grupa B). Stopa trudnoća i implantacijska stopa su vjerodostojno veće u odnosu na grupu B i kontrolu.

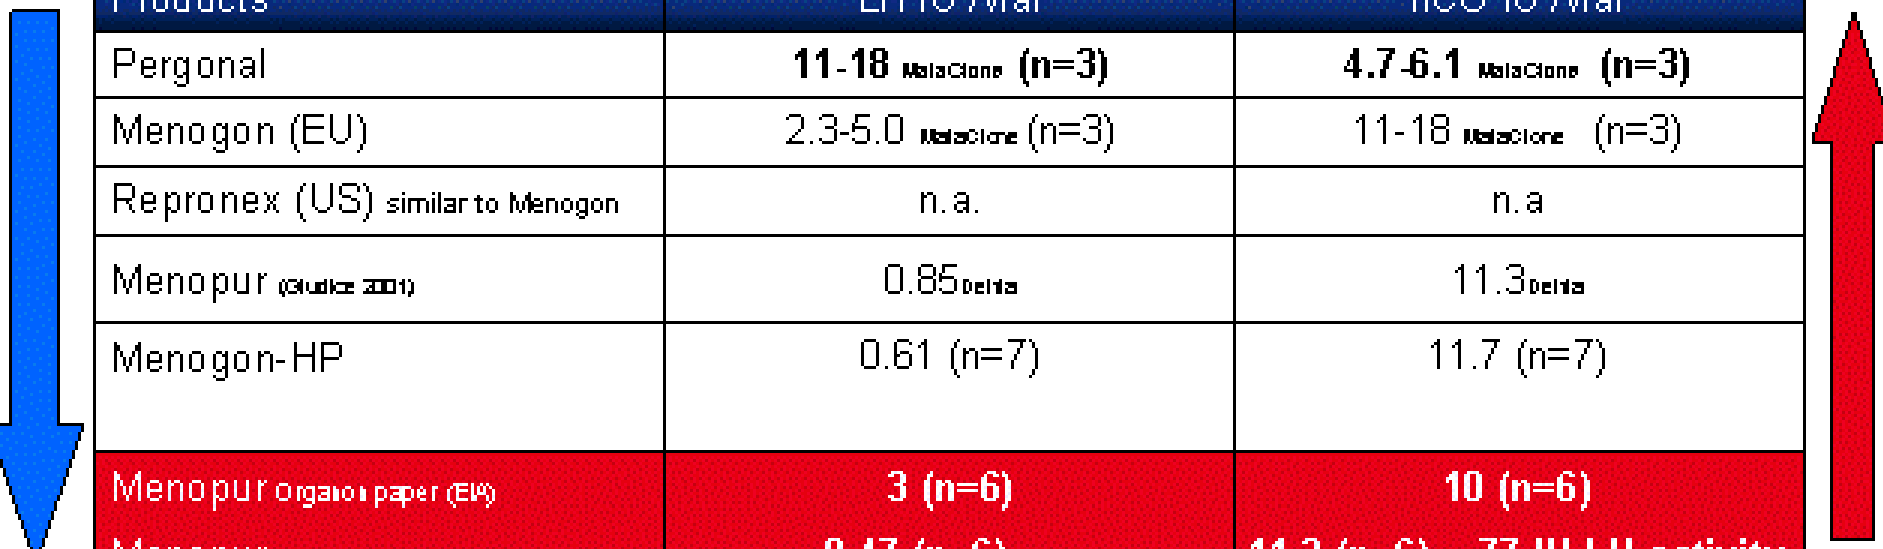

Dodavanje male količine rekombinantnog LH može sačuvati kompetentnost oocite za stvaranje kvalitetnog zametka.

Ferraretti et al 2004 Fertil Steril 82, 1521-1526

**Zašto su takve razlike LH aktivnost
između**

rec-hLH i u-hMG?

The more steps of purification applied, the higher the amount of real LH lost and the hCG spiked
